**And how to End it** Brian Clements 2008 Poetry. This collection of prose poems explores the expansiveness of language as it ranges over particle physics and cosmology, and in how texts network with other texts (some of the poems were generated from other texts, from Google searches, through "interactions" with random texts). Interstitial poems between sections provide structure for the book; built entirely from language that appears elsewhere in the book, they progress according to the Fibonacci sequence, which determines first the number of words in each poem, then the number of words and the number of syllables as the numbers grow larger. Also available from SPD is Brian Clements's collection *DISAPPOINTED PSALMS*. He edits the small press *Firewheel Editions* and its *Sentence: A Journal of Prose Poetics* and coordinates the MFA in Professional Writing at Western Connecticut State University.

Praise for SICK "The gore and action will leave enthralled readers thrilled and then sated with each kill on either side." —Booklist "Between the pacing and the heroes' salty, blue language (full of lovingly creative, genital-inspired insults), reluctant readers who love zombies will devour it, right up to the abrupt end." —Kirkus Reviews "Sick is well written, with great detail, even if it is a little gory." —VOYA Magazine Awards 2014 Quick Picks for Reluctant Young Readers list from YALSA

**Radar Instruction Manual** United States. Maritime Administration 2005 Since 1958 the Maritime Administration has continuously conducted instructions in use of collision avoidance radar for qualified U.S. seafaring personnel and representatives of interested Federal and State Agencies. Beginning in 1963, to facilitate the expansion of training capabilities and at the same time to provide the most modern techniques in training methods, radar simulators were installed in Maritime Administration's three region schools. It soon became apparent that to properly instruct the trainees, even with the advanced equipment, a standardize up-to-date instruction manual was needed. The first manual was later revised to serve both as a classroom textbook and as an onboard reference handbook. This newly updated manual, the fourth revision, in keeping with Maritime Administration policy, has been restructured to include improved and more effective methods of plotting techniques for use in Ocean, Great Lakes, Coastwise and Inland Waters navigation. Robert J. Blackwell Assistant Secretary for Maritime Affairs

**Worlds in the Sky** William Sheehan 1992 Sheehan weaves together scientific history, anecdotes surrounding planetary discoveries, and his own personal reflections as an amateur astronomer to describe how the current understanding of the moon and the planets emerged and how certain individuals in history shaped the world's knowledge about the solar system. Includes bandw illustrations. Annotation copyrighted by Book News, Inc., Portland, OR

**Lifting Titan's Veil** Ralph Lorenz 2002-05-16 The authors use information gathered over nearly four centuries to describe Saturn's moon Titan, the second largest moon in the solar system, and what we know about it based on observations from astronomers, results from the Voyager missions, and other sources.

**Mission Jupiter** Daniel Fischer 2001-06-28 In this exciting story of the Galileo mission to investigate Jupiter, noted astronomer Daniel Fischer weaves together the many disparate facts learned about this most fascinating planet and its satellites. Fischer tells the entire story of Galileo: a behind-the-scenes look at its difficult course from idea to reality; its launch; the problems it encountered early on and how these were resolved; and finally, what will become of the probe. Along the way, the author describes what we have learned about Jupiter, including what the Jovian atmosphere is really like, and the peculiar reality of the planets magnetic field. The story of the journey to Jupiter is combined with interesting details about Galileo's capacities and a graphic description of the solar system, with an episode on how Galileo would judge the chances of finding life on Earth. The book concludes with a look at the future, closing on the Cassini probe to Saturn. Beautifully illustrated and well written, Mission Jupiter shows us space exploration at its best and clearly and vividly conveys the essential science.

**Voyager** Pamela Wilkie 1997

**Robots in Space** Roger D. Launius 2008-01-07 Given the near incomprehensible enormity of the universe, it appears almost inevitable that humankind will one day find a planet that appears to be much like the Earth. This discovery will no doubt reignite the lure of interplanetary travel. Will we be up to the task? And, given our limited resources, biological constraints, and

the general hostility of space, what shape should we expect such expeditions to take? In *Robots in Space*, Roger Launius and Howard McCurdy tackle these seemingly fanciful questions with rigorous scholarship and disciplined imagination, jumping comfortably among the worlds of rocketry, engineering, public policy, and science fantasy to expound upon the possibilities and improbabilities involved in trekking across the Milky Way and beyond. They survey the literature-fictional as well as academic studies; outline the progress of space programs in the United States and other nations; and assess the current state of affairs to offer a conclusion startling only to those who haven't spent time with Asimov, Heinlein, and Clarke: to traverse the cosmos, humans must embrace and entwine themselves with advanced robotic technologies. Their discussion is as entertaining as it is edifying and their assertions are as sound as they are fantastical. Rather than asking us to suspend disbelief, *Robots in Space* demands that we accept facts as they evolve.

*Alien Volcanoes* Rosaly M. C. Lopes 2008-05 At once terrifyingly destructive and awe-inspiringly beautiful, volcanoes have long fascinated humankind. From Vesuvius and Etna to Krakatau and Mount Saint Helen's, these molten rock- and ash-spewing geysers have destroyed whole cities and countless lives, and altered the course of history. Yet our understanding of volcanoes on Earth—and throughout the celestial world—remains maddeningly incomplete. With *Alien Volcanoes*, Rosaly M. C. Lopes and Michael W. Carroll offer a dynamic tour of volcanic activity across the solar system. Through eight gracefully written chapters laced with gripping photographs and stunning artwork, Lopes and Carroll survey the complete spectrum of volcanism in time and

location, from the solar system's origin to the modern era and from the familiar shield volcanoes of the terrestrial worlds to the bizarre superchilled geysers on distant ice moons. In the process, they entertain the possibility of hidden lakes on Saturn's moon Enceladus, discuss the potential effects of greenhouse gases on Neptune's moon Triton, reconstruct the last moments of life for Pompeians in the face of an erupting Mount Vesuvius, and explain how a 4,000-mile-long river of lava could have once flowed freely across the plains of Venus. Richly illustrated with original paintings supplemented by NASA and European Space Agency photographs, *Alien Volcanoes* advances our knowledge of volcanoes on other heavenly bodies, enhances our ability to comprehend how they came into being on Earth, and describes how we might better predict the impact of future eruptions.
